

VitalHealth Platform Training

VitalHealth Platform Training

Introduction to the VitalHealth Platform to support in developing Web based disease management solutions.

General information

The VitalHealth platform facilitates the process of creating new applications with the newest technologies in a smart way. Facilitated by the VitalHealth modeler environment you can create smart web-based applications without advanced programming skills.

Web-based applications consist of a server and client part. The client part is running in the browser of an end user, and the server part is running on the server. The VitalHealth platform is facilitating a smart way to model both the client and the server code. Moreover, the platform facilitates a lot of functions like the secure communication between the client and server, and translating labels for a user's language.

Interesting for whom?

This course is interesting for those who want to acquire the basic knowledge and skills to be able to create a simple web-based application with the VitalHealth modeler environment on the VitalHealth platform.

The course is a first start of getting to know the way the VitalHealth platform works and to be able to model a simple application yourself. In this course we will start from scratch building a simple medical record.

In headlines, the course will pay attention to:

- a. Modeling the client side user interface, using platform user interface controls, events, actions, components and styling.
- b. Modeling the server side data model, events, actions, business logic, data and security layer.

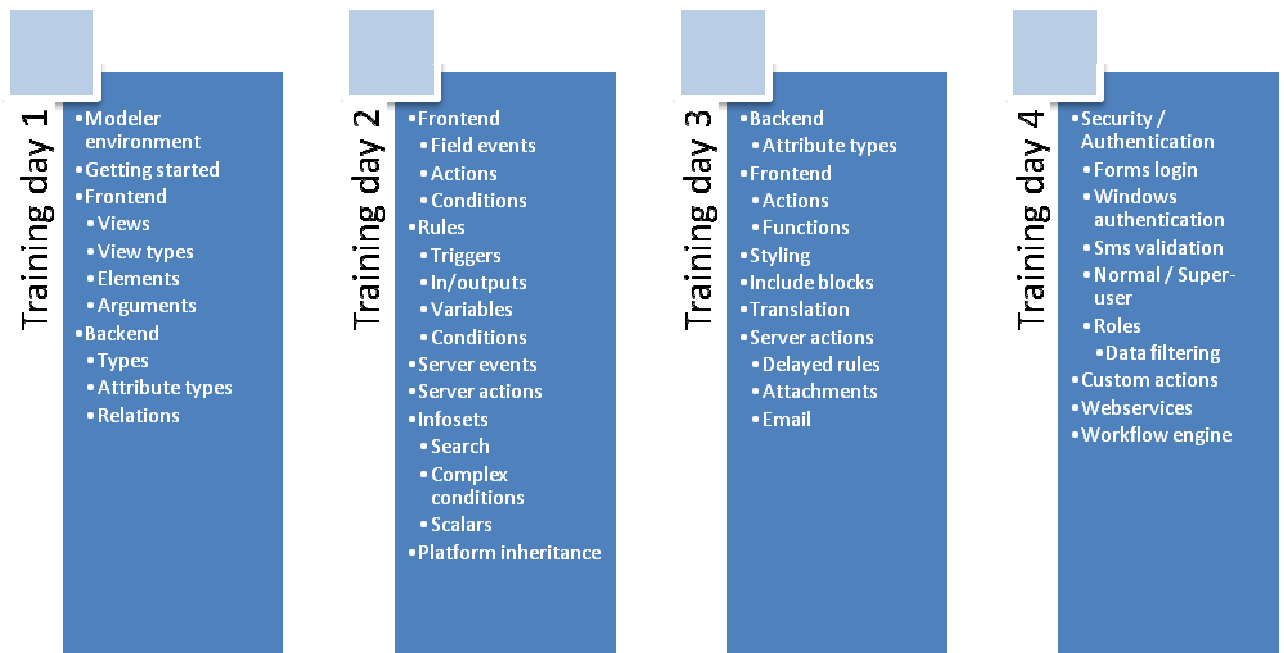

(Please find enclosed a detailed overview of the course content)

After having finalized the course you will be able to build a simple application from scratch with knowledge and skills about modeling both server and client side application.

Prerequisites

For this training, there is no knowledge required of the VitalHealth platform. Programming skills are not needed, but you have to know the basic principles of programming. These basic principles are required to understand and to be able to transform functional needs into a structured way.

Training content

Training material

We provide a VMware environment during the training with all needed software. We will install this on your own laptop. Required for this VMware software is a Windows XP, Vista or 7 installation. Minimum system specification is a dual core 1800Mhz processor with 2 GB internal memory and 15 GB free hardisk space to copy the VMware environment. So please be aware to bring you own laptop with you.

The course material contains a tutorial document which is used for background information about the VitalHealth platform and to do exercises with the VitalHealth Modeler. We also work with the VitalHealth Modeler which is already installed on the system.

Training date by location

Month	Location: Ede
Basic training 11A1	14 ,15 ,28 February / 1 March
Basic training 11A2	16, 17, 30, 31 May
Basic training 11A3	19, 20 September / 3, 4 October
Basic training 11A4	28, 29 November / 19, 20 December

Subscription date

January – December 2010 : 1 month before training

Note: In case there are less than 5 people in total that have subscribed: the training will be postponed to the next training date. We will inform you at least 2 weeks before the training held.

Investment

VitalHealth course code	VHSPLFRM-11A	Price	€ 1950,-* per person for 4 days
Supplier (code)	VitalHealth	Length	4 days

Registration and more information

To sign up, please fill in the enclosed form for registration per attendee. Fax this form to: 0318 – 75 47 01 or e-mail the signed document to: support@vitalhealthsoftware.nl.
