

PROs

Quality Made Visible

What are PROs?

PROs (Patient Reported Outcomes) are usually relatively short and simple questionnaires which can be administered by a healthcare provider. The questionnaires measure the quality and effectiveness of care from the patient's perspective, before, during, and after treatment.

How are PROs Collected?

PROs are used throughout the treatment process to measure the outcome of healthcare or service intervention from a patient's perspective.

How is PROs Data Used?

PROs data is used to help patients and providers better understand patient needs. It can be used to track changes in their health and well-being. The data is also used to improve the overall care process. Additionally, PROs generate valuable research data for population health and benchmarking.

Measure through time

Physicians can routinely monitor and evaluate the progress and status of a patient over time. This can be done while the patient is at the hospital or from home before or after a visit.

Evaluate Treatment Programs

Physicians or external groups can track and evaluate the effectiveness of treatment plans based on the results of a group of patients. The results can then be used as input to improve the treatment processes.
